In my model I have a list of a class that has the main property of each other entity : "Identity". I tried to find a way to get the new identity of a member that I added to my list but it didn't work. I tried something like this : IEnumerable myList =...; foreach(var member in myList) { if(member.Identity == CurrentMemberIdentity) { // Want to set member.Identity to current identity } } A: You can use this: public static T GetNewIdentity(T identity) { if (identity == null) { throw new ArgumentNullException("identity"); } else if (identity == identity.Identity) { return identity; } else { var result = new List() { identity }; result.Insert(0, identity); return result.Last(); } } UPDATE: I thought my answer would not be accepted as I mentioned in my comment to the question a1d647c40b
