The present invention relates generally to a ball and socket hip joint prosthesis, and more particularly to a ball and socket hip joint prosthesis having a femoral head that provides increased resistance to fracture. Hip joint prostheses for replacing the hip joint with a prosthesis have been known for some time. The hip joint prosthesis typically includes an acetabular socket and a spherical femoral head that articulates in the socket. In many known hip joint prostheses, the femoral head is formed of a metal such as cobalt chromium alloy or a ceramic material such as alumina or zirconia. Ceramic material for forming the femoral head can reduce wear of the femoral head, which can be a source of loosening of the hip joint prosthesis. There are, however, problems associated with the use of ceramic for forming the femoral head of a hip joint prosthesis. Ceramic material typically is very brittle. Ceramic material also has a tendency to crack and break, particularly when the ceramic material is made as a monolithic component. In addition, the process of sintering ceramic material requires high temperatures and hence is expensive. Also, the amount of pressure required to form a monolithic ceramic femoral head is high. ### **What's New In?**

A file viewer that removes Microsoft Office passwords. Password support for Microsoft Word, Excel and PowerPoint formats, but not for PowerPoint Viewer, Project or SharePoint. It is based on thorough and time-consuming researches on other tools. Does not crack passwords, it deactivates them, and makes your files accessible again. Ismael Nassar Reviewed: January 13, 2014 Verdict: If you forgot your password for Office, then you may find yourself in a bit of a tight spot, as certain file types are commonly protected. However, iSunshare Office Password Remover can potentially help you decrypt most of the different document types, thanks to a bunch of time-tested tools. The plain text file format enables you to open Office files that are password protected. The application boasts a user-friendly interface and you can open up a file without the need to restart your computer. The only issue with the app is its lack of support for additional file types, but this is not a significant problem as there is another alternative. How to use The uninstaller is available as a standalone application and can easily be launched from within the installation folder. You only need to have an Internet connection in order to initiate the process. Once the application is launched you will be shown a series of folders. You need to make sure the one named in these folders is where the files you wish to decrypt are stored. The application will then display a series of subfolders on your hard drive, one for each file. You need to enter a password if you want the software to unlock the file. A box will appear to ensure you know what you are doing and to prevent accidental input. The software also displays an image file at the top left corner of the screen. This image is located in the program folder and allows you to view the input data on a table, and also copy it. You may want to see the input data, if you need to make changes. To decrypt the file, you will need to enter your password and press the Decrypt button. The input data is then written to a plain text file. A progress window shows you how the application is working. Once the process is done, you will find all of the files in the location where the original was stored. You can do whatever you want with the data, including saving it in different file types. The software also provides various options for moving the files to different locations. The program is not compatible with Office 2003, which is a serious downside, but there is an alternative. The software is the only one that is capable of decrypting Office files that are password protected. This is a significant benefit as you do not have to buy expensive software to handle them. The program will unlock and decrypt Office documents that have been made with Office 2003. The program is very easy to use and will decrypt multiple files at once, so there is no need to do one
